HOW SMALL THEY GO — These carry only a short web address, so the pattern is simple and stays readable down to about 20 mm. Below that, phones begin to struggle.

WHAT HAPPENS ON SCAN — The camera shows the address, the visitor taps it, and the card opens with Save to contacts, WhatsApp and Email on it. They still end up with the full contact, one tap later.

Backup: offline contact codes

THESE SAVE THE CONTACT DIRECTLY — NO WEB PAGE INVOLVED

WHEN TO USE THESE — Scanning one opens the phone's Add Contact screen straight away, with no web page and no internet needed. Useful at venues with no signal, and permanent in a way a web address can never be.

WHY NOT THE DEFAULT — The whole card sits inside the pattern, so the code is dense and needs 35 mm or more of print space. It also skips the branded card page entirely.

Notes

READ ONCE, THEN THROW THIS PAGE AWAY

PRINTING — Print at 100% scale, never "fit to page". Plain white paper beats glossy, which reflects and blocks the camera.

WHAT THE CODES DO — Every code on pages one, two and three opens that person's card at <https://uxdanish.github.io/bizskoop-cards>, where a visitor can save the contact, message on WhatsApp or send an email.

BEFORE A BIG RUN — Print one page and scan every code with both an iPhone and an Android camera. A phone cannot read a code shown on its own screen, so use paper or a second device.
